Calculation of Potential Energy Surfaces
using
ab initio Quantum Chemistry Techniques

Potential Energy Surfaces

Plots of Energy vs Nuclear Coordinates

Cartesian Coordinates = $3N$

Internal Coordinates = $3N-6$ or $3N-5$

3 translations

2-3 rotations

Internal Coordinates are bond lengths and angles

Normal Vibrational Modes Expressed in Terms

Internal Coordinates

$\{x, (1 - e^{-x})\}, \{x, -0.2, 0.2\}$

- quadratic (harmonic oscillator)

ed - Morse potential (atomic interactions)

$$\mathcal{H}\Psi = E\Psi$$

$$\mathcal{H} = T + V = \sum_{i=1}^n \frac{p_i^2}{2m_e} - \sum_N \sum_i \frac{Z_N e^2}{r_{iN}} + \sum_{M>N} \frac{Z_M Z_N e^2}{R_{MN}} + \sum_{i>j} \frac{e^2}{r_{ij}}$$

$$\Psi = \begin{vmatrix} \chi_1(1) & \chi_2(1) & \cdots & \chi_n(1) \\ \chi_1(2) & \chi_2(2) & \cdots & \chi_n(2) \\ \vdots & \vdots & \ddots & \vdots \\ \chi_1(n) & \chi_2(n) & \cdots & \chi_n(n) \end{vmatrix}$$

The Variation Theorem States:

$$E' = \frac{\int \Phi^* \mathcal{H} \Phi d\tau}{\int \Phi^* \Phi d\tau} > E \quad \text{where } \Phi \text{ is a trial wavefunction and } \Phi_k = \sum_i c_{ki} \phi_i$$

$\frac{\partial E'}{\partial c_{ki}} = 0$ leads to the Roothan-Hall equations

$$\sum_{v=1}^n (F_{uv} - \epsilon_i S_{uv}) c_{vi} = 0 \quad u = 1, 2, \dots, n$$

Configuration Interaction

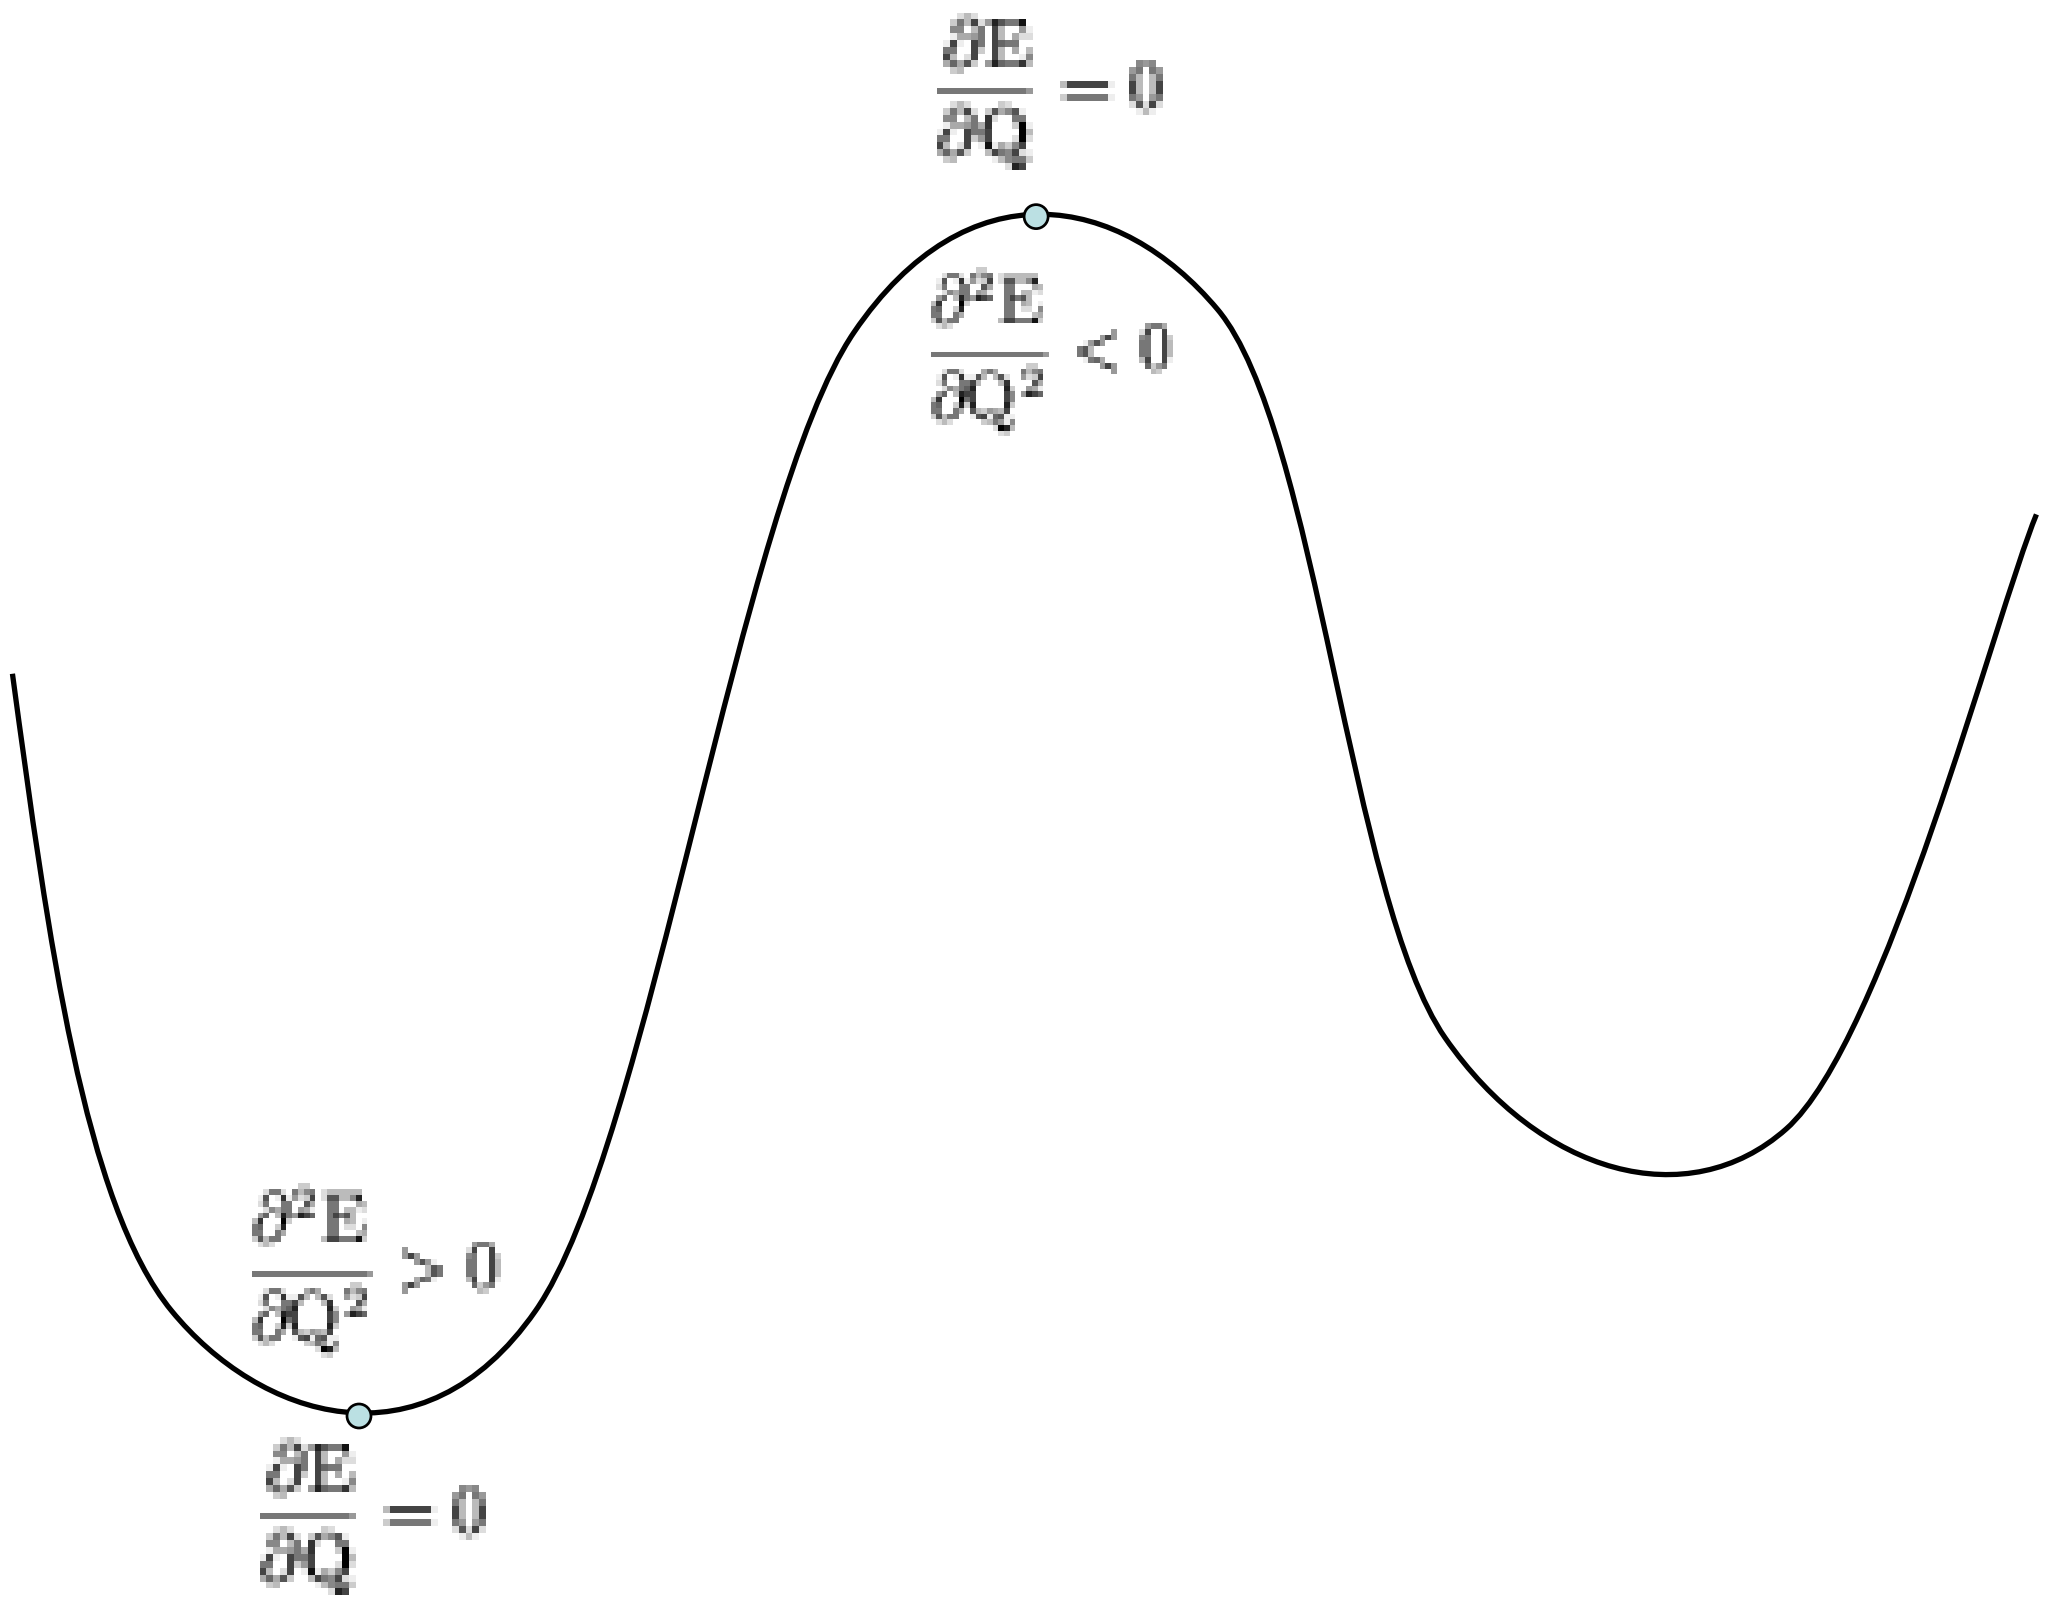

$$\Psi \approx c_0 |\Psi_0\rangle + \left(\frac{1}{1!}\right)^2 \sum_{ar} c_a^r |\Psi_a^r\rangle + \left(\frac{1}{2!}\right)^2 \sum_{abrs} c_{ab}^{rs} |\Psi_{ab}^{rs}\rangle + \left(\frac{1}{3!}\right)^2 \sum_{abrst} c_{abc}^{rst} |\Psi_{abc}^{rst}\rangle + \dots$$

Moller-Plessett Perturbation Theory

$$E_0^{(0)} = \sum_a \epsilon_a \quad E_0^{(1)} = \langle \Psi_0 | V | \Psi_0 \rangle \quad E_0^{(0)} + E_0^{(1)} = \text{HF Energy}$$

$$E_0^{(2)} = \sum_{a < b} \frac{\left| \langle \Psi_0 | \sum_{i < j} \frac{1}{r_{ij}} | \Psi_{ab}^{rs} \right|^2}{\epsilon_a + \epsilon_b + \epsilon_r + \epsilon_s}$$

Occupied orbitals

Virtual orbitals

Tricyclo[3.1.0.0^{2,6}]hexane (TC6) Isomerization

Allowed Pathway

Activation Energies in kcal/mol (including ZPE)

MCSCF	MCQDPT2	CCSD(T)	MP2	B3LYP

TC6 \rightarrow (E,Z)-C6D

(E,Z)-C6D \rightarrow (Z,Z)-C6D

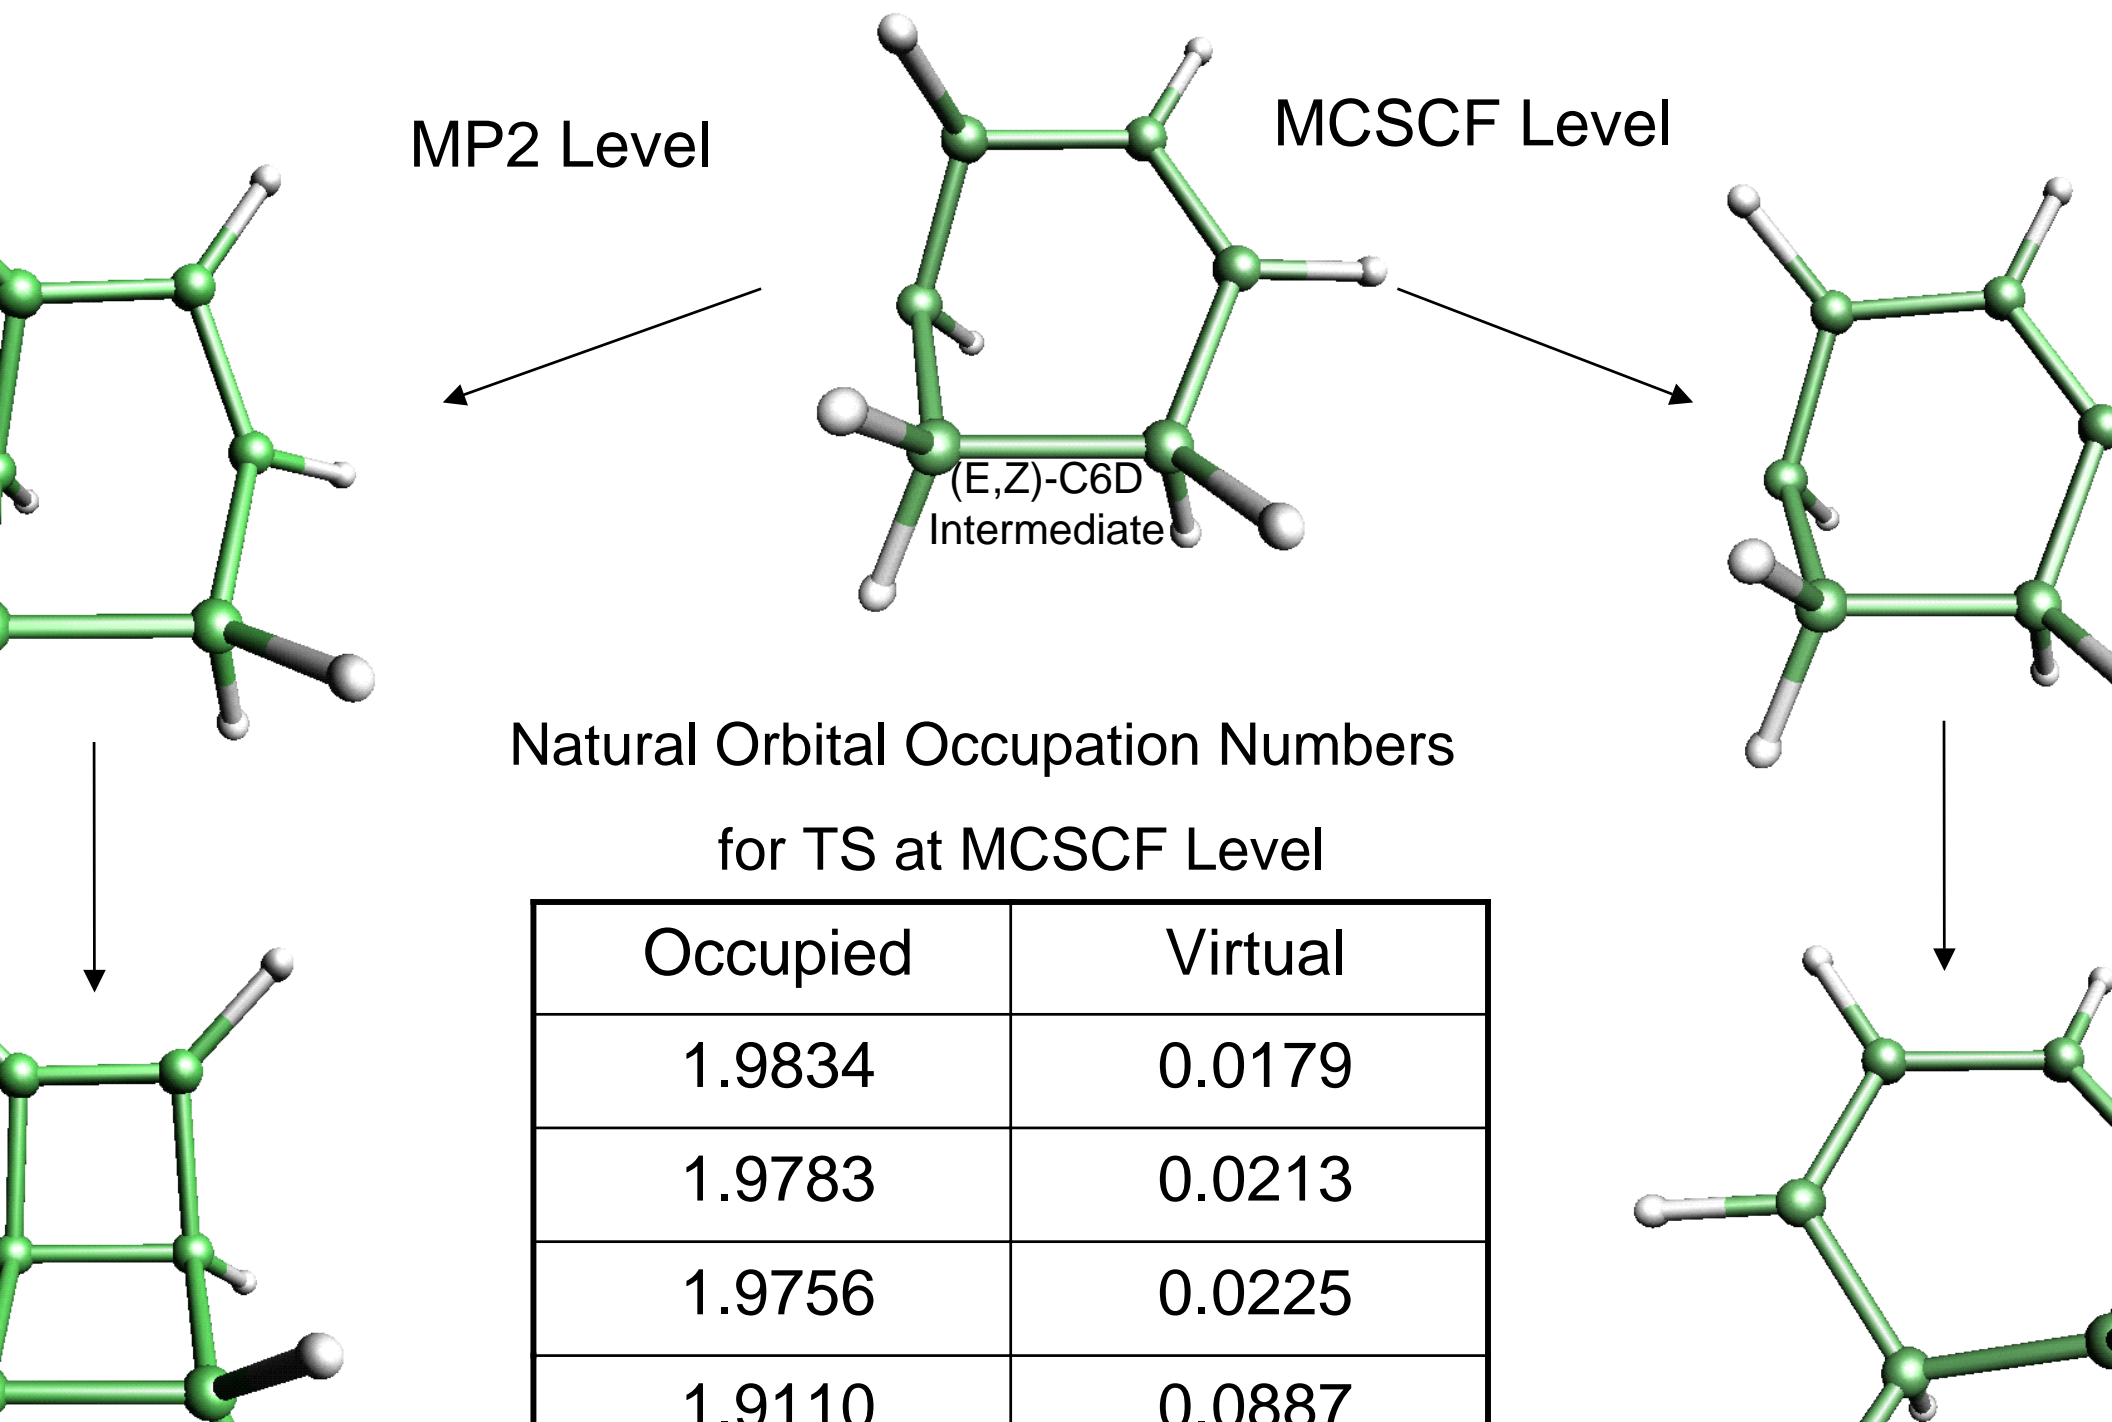

TC6 \rightarrow C6D

Plot of Bond Distance vs. Reaction Coordinate

at the MP2 and MCSCF Levels

Forbidden Pathway

Occupied Molecular Orbitals and Natural Orbital Occupation Numbers

1.9597

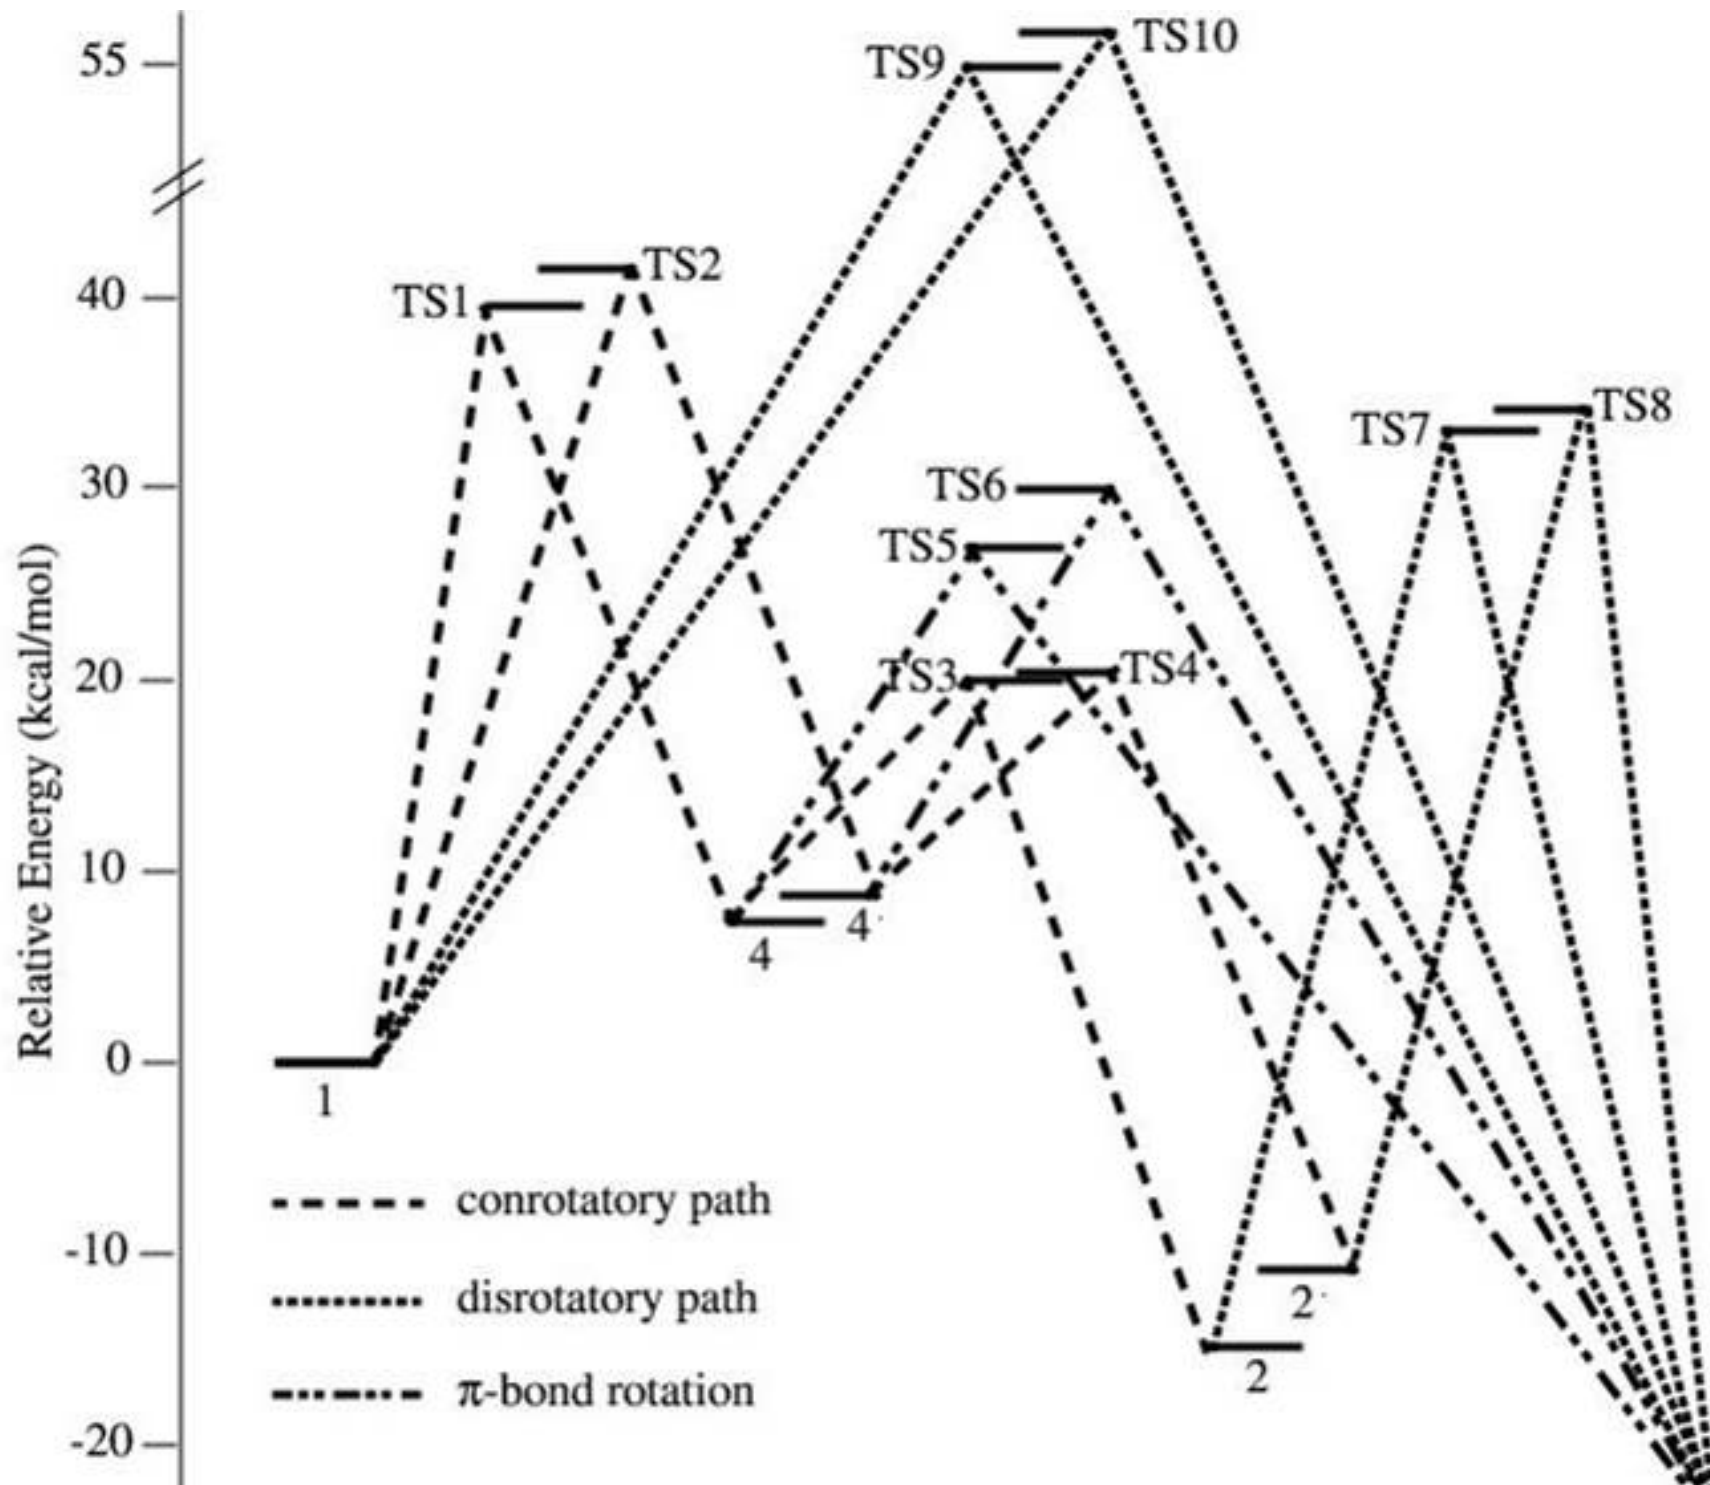

1.9819

Tricyclo[4.1.0.0^{2,7}]heptane Isomerization

Reaction Summary

Views of Chemistry

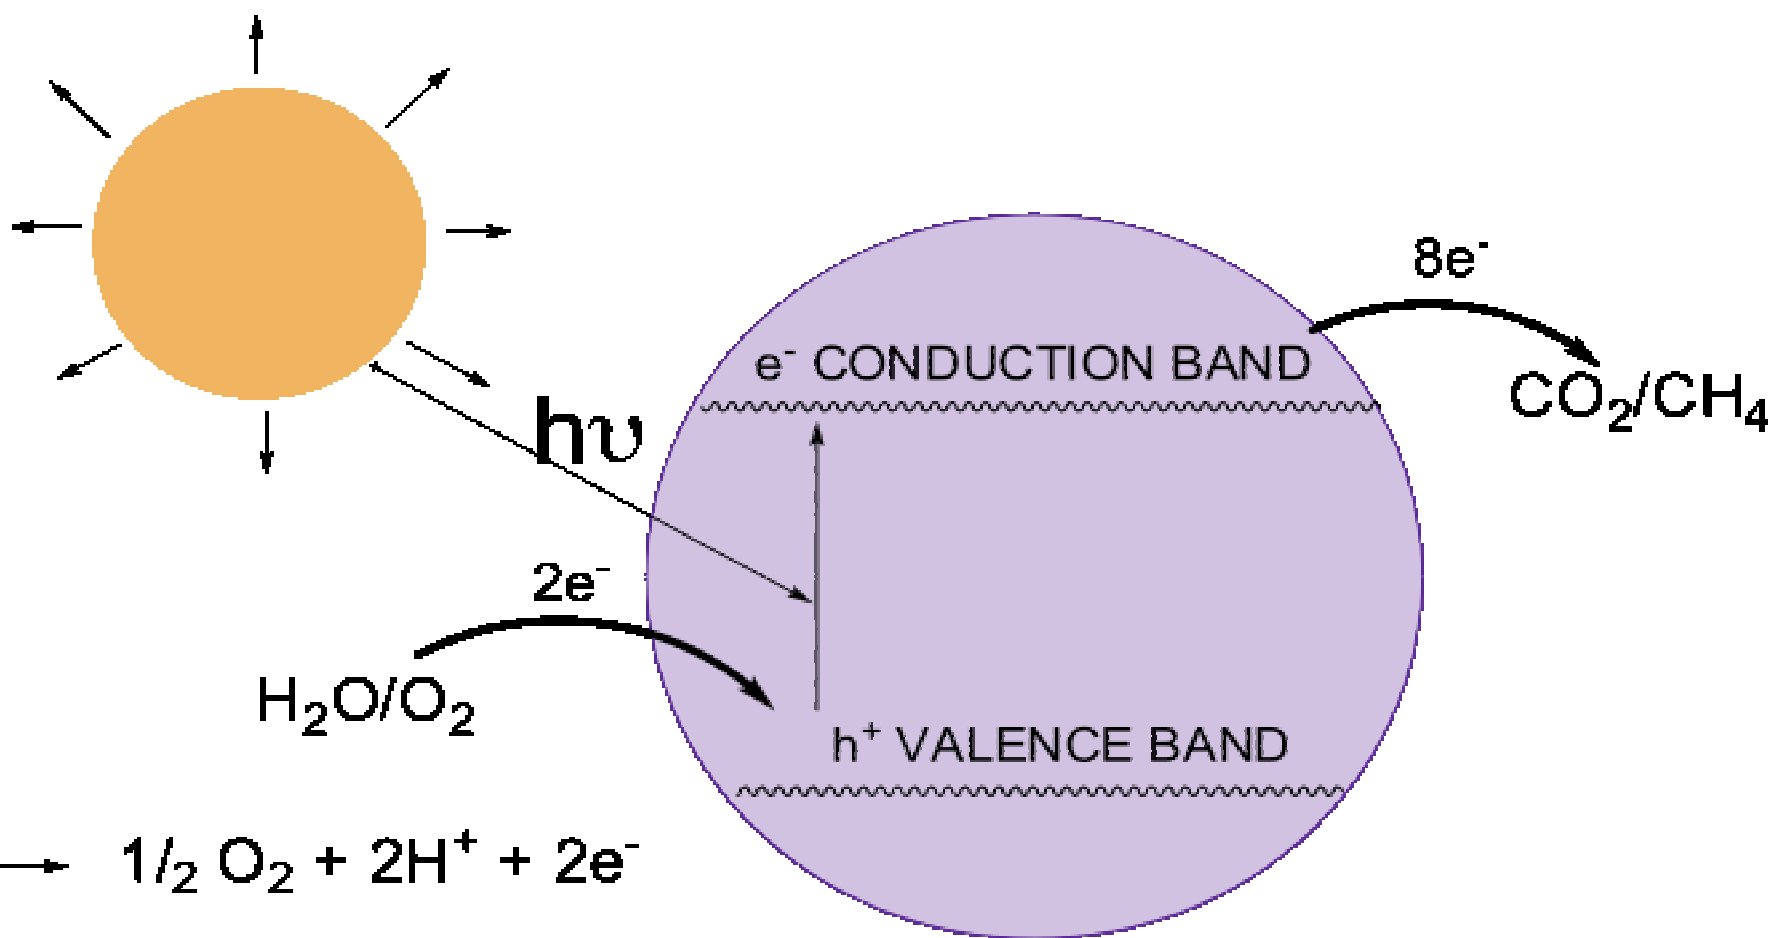

Every attempt to employ mathematical methods in the study of chemical questions must be considered profoundly irrational and contrary to the spirit of chemistry. If mathematical analysis should ever hold a prominent place in chemistry – an aberration which is happily almost impossible – it would occasion rapid and widespread degeneration of that science.”

Compte Philosophie Positive 1830.

“The more progress physical sciences make, the more they tend to enter the domain of mathematics, which is a kind of center to which they all converge. We may even judge the degree of perfection to which a science has arrived by the facility with which it may be submitted to calculation.”

A. Quetelet, *Instructions Populaires sur le Calcul des Probabilites*, Tarlier, Brussels, 1828.

CO₂ photocatalytic reduction

Venkata Pradeep Indrakanti, J.D.Kubicki, M.M. Maroto-Valer, H.H. Schobert

July 11, 2007

CHEMRAWN-XVII and ICCDU-IX conference on greenhouse gases

Objectives

Identify the intermediate species formed during CO₂ photoreduction
Modeling the excited-state chemistry of CO₂ species adsorbed on
various low index surface planes of TiO₂ .

Test the hypothesis of dopant-induced charge carrier trapping
affecting photoactivity by performing photoreactions with various
concentrations of La, Sm and Gd-doped TiO₂ as photocatalysts.

Study the intermediates of this photoreduction through spectroscopic
characterizations and use computational methods to
corroborate/complement spectroscopic data.

singlet

B3LYP/6-31+G(d) C_{2v} symmetry

132.24

Bond lengths in Å, angles in degrees
